Dear Hiring Manager,

I am applying for the Senior Data Engineer role at Too Good To Go. Owning a shipment-events pipeline and publishing freight-rate dbt tests draws me to the Parcels role's logistics focus. I would bring experience connecting delivery data with operational questions.

- **Logistics**: process 40 million shipment events daily from Kafka into PostgreSQL and BigQuery with Airflow; built Python ingestion for partner price feeds.
- **Performance**: cut a nightly mart rebuild from 6 hours to 55 minutes with dbt and the BigQuery bill by 35%.
- **Collaboration**: defined a data contract with five producing teams and wrote a warehouse migration guide used by four teams. This is my adjacent experience for working with Product Managers and Tech Leads and linking to a central Data Platform team.

I lack experience with dlt, AWS, Redshift, Lambda, Kinesis, S3, Glue, GitOps and Metaflow. I also cannot claim experience guaranteeing high data availability, defining SLAs or enforcing platform standards, nor documented experience being asked to push back on requirements or working in an agile environment.

Instead, I bring Kafka, Airflow, Python ingestion, Terraform and GitHub Actions for CI/CD, plus Docker skills. Great Expectations tests on 30 tables cut failed loads by 70% in the first quarter. Alerting, an on-call runbook, cross-team contracts and analyst training provide foundations for the reliability and collaboration gaps.

I live in Copenhagen, can accommodate four office days within 40 hours weekly, and have EU work authorisation without sponsorship. I have no security clearance. With three months' notice, my earliest start is 1 February 2027. I would welcome a discussion.

Yours sincerely,

Alex Fernsby
