Dear Too Good To Go hiring team,

I am applying for the Senior Data Engineer role in the Parcels domain. Since 2022 I have owned Tidewater Logistics' shipment-events pipeline: 40 million events a day from Kafka into PostgreSQL and BigQuery, orchestrated with Airflow. I want to bring that end-to-end ownership to a product team where parcel latency and inventory data shape the product.

Parcels has delivered 300,000 parcels of surplus food from FMCG manufacturers in the UK with CEVA Logistics since 2024. That is a logistics data problem as much as a sustainability one, and it needs pipelines that operations, logistics partners and brands can trust. The food-waste mission is why I want to work here. The Parcels domain is where that experience can make delivery and partner data trustworthy.

My work matches the role in five areas:

- Logistics and operations: I cut the nightly rebuild of our delivery-performance mart from six hours to 55 minutes with incremental dbt models, and built a Looker explore so planners answer delivery-delay questions themselves.
- Data quality and SLAs: Great Expectations tests on 30 core tables cut failed loads by 70 percent.
- Cross-functional collaboration: I defined the shipment-events data contract with five producing teams and lead the weekly data-modelling review.
- Operational maturity: I moved deployments to a Git-based workflow with GitHub Actions and Terraform, so a new environment takes 20 minutes instead of two days, and wrote the on-call runbook.
- Streaming and batch: Kafka into BigQuery at 40 million events a day, Airflow orchestration, and Python ingestion handling about two million partner price-feed rows a day.

My warehouse depth is in BigQuery, not Redshift, and I have not used dlt or Metaflow in production. I supported a PostgreSQL-to-BigQuery migration, validating 60 tables row by row, so I know what a platform migration demands. I would rather say that plainly than blur it.

I trained 12 analysts on dbt at Marlow and reviewed their first 40 models. I push back on requirements that will not survive the data model, and I gave a talk on data contracts in practice at the Rotterdam Data Meetup.

I am based in Copenhagen and can work four days a week in the HQ. I am available from 1 February 2027 after my notice period. I look forward to hearing from you.

Kind regards,

Alex Fernsby
