Dear Hiring Manager,

I am applying for the Senior Data Engineer role at A.P. Moller - Maersk. I want to bring end-to-end pipeline ownership to this senior individual-contributor role. My current work connects shipment events, tested warehouse tables and reporting that operations planners can use independently.

- **Scale**: I own a Kafka pipeline that moves 40 million shipment events daily into PostgreSQL and BigQuery, orchestrated with Apache Airflow.
- **Performance**: Incremental dbt models reduced a delivery-performance mart's nightly rebuild from 6 hours to 55 minutes.
- **Reliability**: Great Expectations tests on 30 core tables reduced failed loads by 70% in the first quarter; I also documented the pipeline's on-call runbook.

I would bring practical experience defining data contracts with five producing teams so self-service consumers can trust what they query, and building a Looker explore that lets planners answer delivery-delay questions themselves. I mentor two junior engineers and lead weekly modelling reviews. These are concrete ways I help colleagues use and maintain data products, working closely with the teams that produce and consume them. At Marlow Retail Group, I trained 12 analysts on dbt and reviewed their first 40 models, helping them work with the warehouse.

I have a gap against the full data engineering experience requirement: I lack PySpark and distributed data processing. My adjacent foundation is Python ingestion, Kafka pipelines and BigQuery optimization. I have no documented AI/ML engineering or Claude Code experience, nor experience with LLM-based applications or Claude Code; tested datasets and repeatable ingestion provide adjacent foundations for machine learning enablement.

I live in Copenhagen and can work in the EU without sponsorship. My earliest start is 1 February 2027, following three months' notice.

I would welcome a discussion of the role and my contribution.

Yours sincerely,

Alex Fernsby
